

## Second Example

lino.gendoc has its own paragraph parser which replaces ReportLab's parser.

A test is a `<em>test</em>` and not a `<em>final document</em>`.

A test is a `<em>test</em>` and not a `<em>final document</em>`.

A test is a `<em>test</em>` and not a `<em>final document</em>`.

A test is a *test* and not a *final document*. A test is a *test* and not a *final document*. A test is a *test* and not a *final document*.

About character formatting: *emphasized* is same as *italic*.

*italic*, **bold** and ***bold-italic*** are implemented using separate fonts, while <sup>superscript</sup> simply raises the baseline.

Now the same text in underlined: *italic*, **bold** and ***bold-italic*** are implemented using separate fonts, while <sup>superscript</sup> simply raises the baseline.
