

## Fourth Example

### Using manual line breaks

It seems quite hard to implement manual line breaks with `reportlab.platypus`. This is for later. For now we just ignore them.

Fortunately there is a workaround that should help in most cases: You can avoid automatic word wrapping by using `verses()`. The `verses()` method is similar to `memo()`, except that it creates `XPreformatted` paragraph instances instead of the standard `Paragraph`.

There was a young man in Japan Who wrote verses that never would scan. When asked how this was He said "It's because I alwa

### Styles

The `heading()`, `pre()` and `memo()` methods have an optional second argument: the name of a *Style* to be used. For the moment let's just play around with some of them.

This text is aligned right

You can also get formatting by using the HTML syntax. This works at least in one case...
